3 4.4 Expectation of a Function of a Discrete Random Variable

4.5 Variance

- < ロ > < 個 > < 注 > < 注 > 三 - の < @

One of the most important concepts in probability theory is that of the expectation of a random variable.

Definition

General Info

Suppose X is a discrete random variable with mass function $p(\cdot)$. If

$$\sum_{|p(x)|>0} |x|p(x) < \infty$$

then we say that X has finite expectation and we define

$$E[X] = \sum_{x:p(x)>0} xp(x)$$

to be the expectation of X. If $\sum_{x:p(x)>0} |x|p(x) = \infty$, the expectation of X is undefined.

4.5 Variance

One of the most important concepts in probability theory is that of the expectation of a random variable.

Definition

General Info

Suppose X is a discrete random variable with mass function $p(\cdot)$. If

$$\sum_{p(x)>0} |x|p(x) < \infty$$

then we say that X has finite expectation and we define

x:

$$\mathrm{E}[\mathrm{X}] = \sum_{\mathrm{x}: \mathrm{p}(\mathrm{x}) > 0} \mathrm{x} \mathrm{p}(\mathrm{x})$$

to be the expectation of X. If $\sum_{x:p(x)>0} |x|p(x) = \infty$, the expectation of X is undefined.

Suppose that A is an event and define

$$I = \begin{cases} 1 & \text{if } A \text{ occurs} \\ 0 & \text{otherwise.} \end{cases}$$

Then
$$E[I] = 0 \cdot P(A^c) + 1 \cdot P(A) = P(A)$$
.

Example 2

If X is the outcome when we roll a fair die, then

$$p(1) = \cdots = p(6) = \frac{1}{6}.$$

Thus $E[X] = \frac{7}{2}$.

General Info	4.3 Expected Values	4.4 Expectation of a Function of a Discrete Random Variable ○●○○○	4.5 Variance

Suppose that *X* is a discrete random variable with mass function $p(\cdot)$. Suppose φ is a function on \mathbb{R} . Then $\varphi(X)$ is a discrete random variable. We want to find $\mathbb{E}[\varphi(X)]$. Before presenting the general theorem, let's looking at an example first.

Example 1

Suppose that

$$P(X = -1) = \frac{1}{5}, P(X = 0) = \frac{1}{2}, P(X = 1) = \frac{3}{10}$$

Find $E[X^2]$.

Let $Y = X^2$. Then $P(Y = 0) = P(Y = 1) = \frac{1}{2}$. Thus $E[X^2] = \frac{1}{2}$.

eneral Info	4.3 Expected Values	4.4 Expectation of a Function of a Discrete Random Variable ○●○○○	4.5 Variance

4.5 Variance

I am not going to give a proof of the above proposition. Let's apply this proposition to the previous example:

$$\mathbf{E}[\mathbf{X}^2] = (-1)^2 \cdot \frac{1}{5} + 0^2 \cdot \frac{1}{2} + 1^2 \cdot \frac{3}{10} = \frac{1}{2},$$

which coincides with the answer we found before.

Example 2

A coin is tossed 4 times. Suppose that the probability of Heads is $\frac{2}{3}$ on each toss. Let X be the total number of Heads. Find $E[\sin(\frac{\pi X}{2})]$.

$$E[\sin(\frac{\pi X}{2})] = \sum_{k=0}^{4} \sin(\frac{k\pi}{2}) \binom{4}{k} (\frac{2}{3})^{k} (\frac{1}{3})^{4-k}$$
$$= 4 \cdot \frac{2}{3} \cdot (\frac{1}{3})^{3} - 4 \cdot (\frac{2}{3})^{3} \cdot \frac{1}{3}.$$

4.5 Variance

I am not going to give a proof of the above proposition. Let's apply this proposition to the previous example:

$$\mathbf{E}[\mathbf{X}^2] = (-1)^2 \cdot \frac{1}{5} + 0^2 \cdot \frac{1}{2} + 1^2 \cdot \frac{3}{10} = \frac{1}{2},$$

which coincides with the answer we found before.

Example 2

A coin is tossed 4 times. Suppose that the probability of Heads is $\frac{2}{3}$ on each toss. Let *X* be the total number of Heads. Find $E[sin(\frac{\pi X}{2})]$.

$$E[\sin(\frac{\pi X}{2})] = \sum_{k=0}^{4} \sin(\frac{k\pi}{2}) \binom{4}{k} (\frac{2}{3})^{k} (\frac{1}{3})^{4-k}$$
$$= 4 \cdot \frac{2}{3} \cdot (\frac{1}{3})^{3} - 4 \cdot (\frac{2}{3})^{3} \cdot \frac{1}{3}.$$

4.5 Variance

I am not going to give a proof of the above proposition. Let's apply this proposition to the previous example:

$$\mathbf{E}[\mathbf{X}^2] = (-1)^2 \cdot \frac{1}{5} + 0^2 \cdot \frac{1}{2} + 1^2 \cdot \frac{3}{10} = \frac{1}{2},$$

which coincides with the answer we found before.

Example 2

A coin is tossed 4 times. Suppose that the probability of Heads is $\frac{2}{3}$ on each toss. Let *X* be the total number of Heads. Find $E[sin(\frac{\pi X}{2})]$.

$$\begin{split} \mathrm{E}[\sin(\frac{\pi \mathrm{X}}{2})] &= \sum_{k=0}^{4} \sin(\frac{k\pi}{2}) \binom{4}{k} (\frac{2}{3})^{k} (\frac{1}{3})^{4-k} \\ &= 4 \cdot \frac{2}{3} \cdot (\frac{1}{3})^{3} - 4 \cdot (\frac{2}{3})^{3} \cdot \frac{1}{3}. \end{split}$$

4.4 Expectation of a Function of a Discrete Random Variable

4.5 Variance

Corollary

If X is a discrete random variable, and a, b are constants, then

E[aX + b] = aE[X] + b.

This corollary follows immediately from the proposition. Let $p(\cdot)$ be the mass function of X. Then

$$E[aX + b] = \sum_{x} (ax + b)p(x) = a\sum_{x} xp(x) + b\sum_{x} p(x)$$
$$= aE[X] + b.$$

The expectation of X, E[X], is also called the first moment of X. For any integer $n \ge 1$, E[Xⁿ], if exists, is called the *n*-th moment of X. If X is a discrete random variable with mass function $p(\cdot)$, then

$$E[X^n] = \sum x^n p(x).$$

4.4 Expectation of a Function of a Discrete Random Variable

4.5 Variance

Corollary

If X is a discrete random variable, and a, b are constants, then

E[aX + b] = aE[X] + b.

This corollary follows immediately from the proposition. Let $p(\cdot)$ be the mass function of *X*. Then

$$E[aX + b] = \sum_{x} (ax + b)p(x) = a\sum_{x} xp(x) + b\sum_{x} p(x)$$
$$= aE[X] + b.$$

Definition

General In

Suppose that X is a discrete random variable with finite $E[X] = \mu$. If $E[(X - \mu)^2]$ exists, we call it the variance of the random variable X:

$$\operatorname{Var}(X) = \operatorname{E}[(X - \mu)^2].$$

The square root of Var(X) is called the standard deviation of X:

$$\mathrm{SD}(X) = \sqrt{\mathrm{Var}(X)}.$$

Var(X) is always non-negative. It measures how spread-out the random variable X is from its mean. If Var(X) = 0, then X is deterministic.

Here is another formula for Var(X):

$$\operatorname{Var}(X) = \operatorname{E}[X^2] - (\operatorname{E}[X])^2.$$

Here is a derivation. Let $p(\cdot)$ be the mass function of *X*.

$$Var(X) = E[(X - \mu)^{2}] = \sum_{x} (x - \mu)^{2} p(x)$$
$$= \sum_{x} (x^{2} - 2\mu x + \mu^{2}) p(x)$$
$$= \sum_{x} x^{2} p(x) - 2\mu \sum_{x} x p(x) + \mu^{2} \sum_{x} p(x)$$
$$= E[X^{2}] - 2\mu \cdot \mu + \mu^{2} = E[X^{2}] - \mu^{2}$$
$$= E[X^{2}] - (E[X])^{2}.$$
